MATRL 218/CHEM 277: Introduction to Inorganic Materials

Catalog Description:
An introduction to typical inorganic materials, with an emphasis on crystalline materials (some discussion of quasicrystalline and amorphous materials) and how their material properties can be understood based on the constituent atoms, and the crystal and electronic structure. Includes rudiments of crystallography, and notions of how crystal structures are built up from the concepts of close-packing and of the linking of polyhedra. Some discussion of specific structure types with reference to advanced material properties such as superconductivity, ferroic behavior and magnetism.

Target audience:
The course is for graduate students with some prior knowledge of inorganic materials and crystallography. Advanced undergraduate students are welcome.

Textbooks (none are required):

Instructor:
Ram Seshadri, Professor of Materials, and Chemistry and Biochemistry
MRL Rm 3008, x6129, seshadri@mrl.ucsb.edu

Course Website:
http://www.mrl.ucsb.edu/~seshadri/teach.html
Grading:

4 best from 5/6 assignments (30%), midterm (30%), Take-home final (40%).

Outline:

1. Recent excitement in understanding structure-property relationships

2. Classification of materials as amorphous and crystalline, and the structural hierarchy in a polycrystalline material. Quasicrystalline and amorphous materials. The glass transition.

3. Cohesion in solids ionic, covalent, metallic, van der Waals

4. Crystallography in a nutshell: Lattices, unit cells, symmetry  how crystallography simplifies the depiction of structures

5. Packings: CCP and HCP, voids, radius ratio rules, the structures of elements – α-Po, Fe, Cu, Mg, Si, C (graphite)

6. Pauling’s rules for ionic crystals and the concept of Bond Valence

7. Description of some crystal structures: AB, AB₂, AB₃ (ReO₃), perovskites, K₂NiF₄

8. Electronic structures of crystalline solids – energy bands, densities of states, crystal fields, the band gaps in semiconductors

9. Metals, non-metals and the metal-insulator transitions  examples of perovskites

10. Cooperative magnetism in solids – examples of perovskites and spinels

11. Structural phase transitions in solids – the example of BaTiO₃

12. Special topics: Structure-property relations in advanced materials:

   (a) GMR/CMR: Systems and phenomena
   (b) Polar materials: Normal and relaxor ferroelectrics, and piezoelectric materials
   (c) High $T_C$ superconductors
